

AGRICULTURAL SENSING

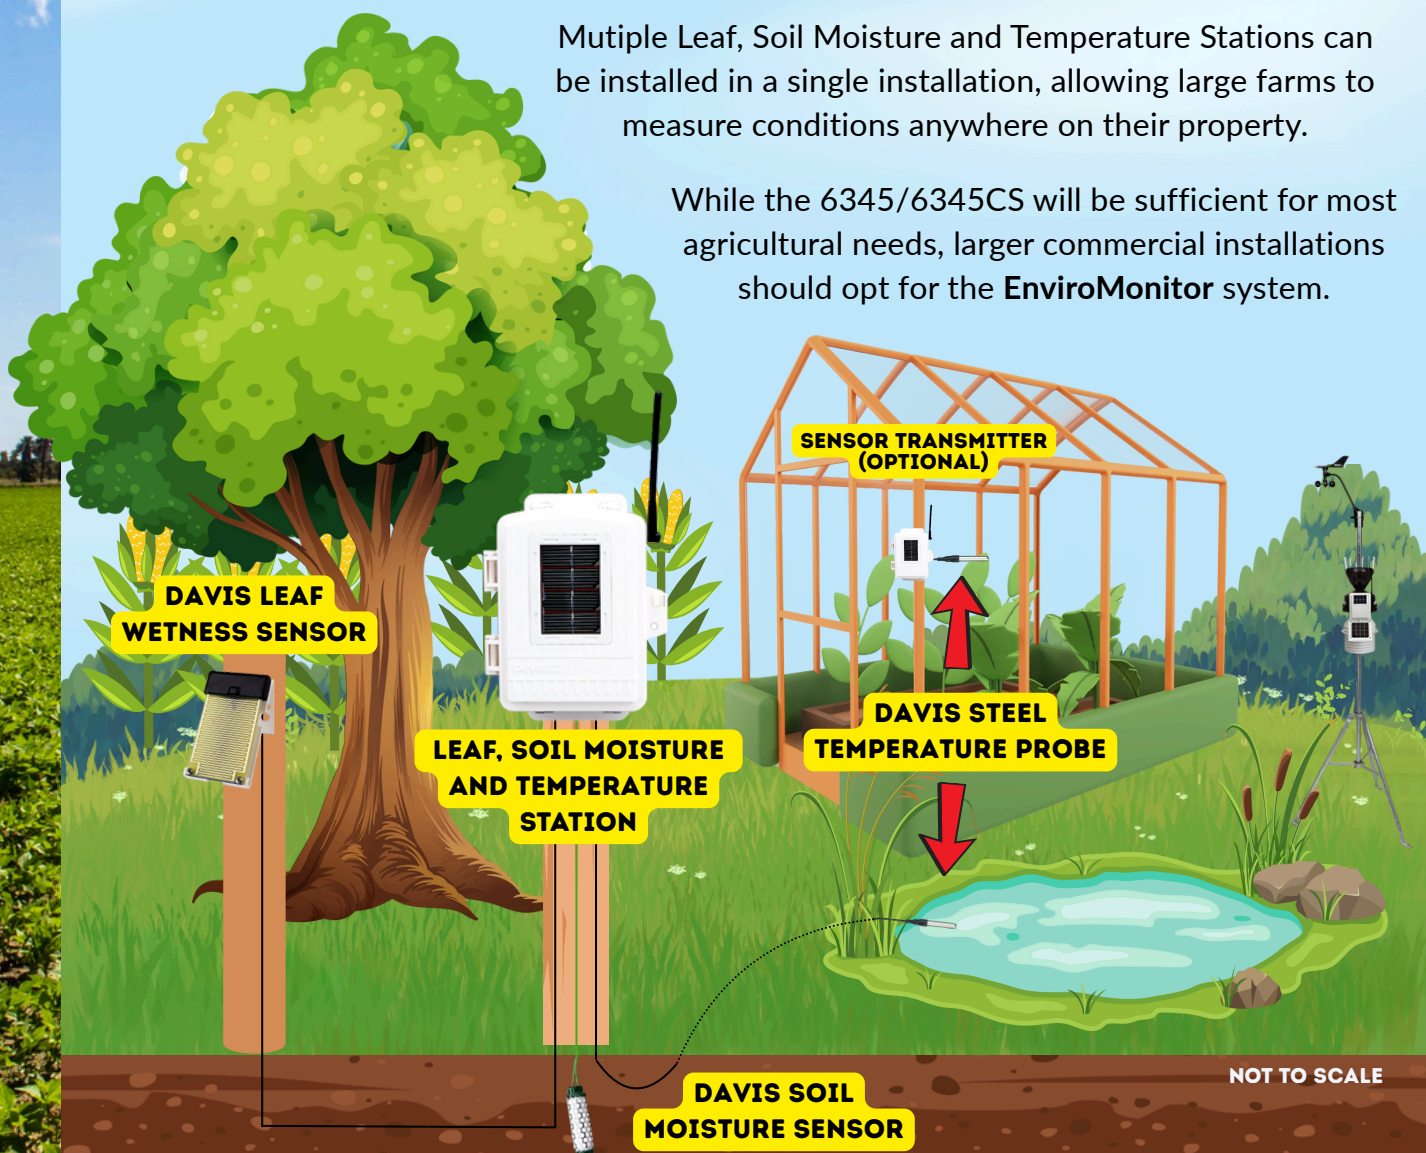

with **DAVIS**

The Davis Vantage Pro2 is the best consumer grade weather station available for agriculture. Each Leaf, Soil Moisture and Temperature Station can handle up to **ten sensors**.

Sensors are hardwired to the station, but a sensor transmitter (page 15) can be optionally added to connect distant sensors to your station. The steel temperature probe is multi-use: it can be used to measure the temperature of air and water (pictured) as well as soil. All lines can be buried if desired.

Multiple Leaf, Soil Moisture and Temperature Stations can be installed in a single installation, allowing large farms to measure conditions anywhere on their property.

While the 6345/6345CS will be sufficient for most agricultural needs, larger commercial installations should opt for the **EnviroMonitor** system.
